

## General Description

The MAX6316–MAX6322 family of microprocessor ( $\mu$ P) supervisory circuits monitors power supplies and microprocessor activity in digital systems. It offers several combinations of push/pull, open-drain, and bidirectional (such as Motorola 68HC11) reset outputs, along with watchdog and manual reset features. The *Selector Guide* below lists the specific functions available from each device.

These devices are available in 26 factory-trimmed reset threshold voltages (from 2.5V to 5V, in 100mV increments), featuring four minimum power-on reset timeout periods (from 1ms to 1.12s), and four watchdog timeout periods (from 6.3ms to 25.6s). Thirteen standard versions are available with an order increment requirement of 2500 pieces (see *Standard Versions* table); contact the factory for availability of other versions, which have an order increment requirement of 10,000 pieces.

The MAX6316–MAX6322 are offered in a miniature 5-pin SOT23 package.

## Applications

Portable Computers  
Computers  
Controllers  
Intelligent Instruments  
Portable/Battery-Powered Equipment  
Embedded Control Systems

**Typical Operating Circuit and Pin Configurations appear at end of data sheet.**

## Selector Guide

\* The MAX6318/MAX6319/MAX6321/MAX6322 feature two types of reset output on each device.

## Benefits and Features

- Integrated Configuration Enables Flexible Designs
  - Available in 26 Reset-Threshold Voltages
    - 2.5V to 5V, in 100mV Increments
  - Four Reset Timeout Periods
    - 1ms, 20ms, 140ms, or 1.12s (min)
  - Four Watchdog Timeout Periods
    - 6.3ms, 102ms, 1.6s, or 25.6s (typ)
  - Four Reset Output Stages
    - Active-High, Push/Pull
    - Active-Low, Push/Pull
    - Active-Low, Open-Drain
    - Active-Low, Bidirectional
- Integrated Features Increase Robustness
  - Guaranteed Reset Valid to  $V_{CC} = 1V$
  - Immune to Short-Negative  $V_{CC}$  Transients
- Saves Board Space
  - No External Components
  - Small 5-Pin SOT23 Package

## Ordering Information

| PART               | TEMP RANGE      | PIN-PACKAGE |
|--------------------|-----------------|-------------|
| MAX6316LUK____-T   | -40°C to +125°C | 5 SOT23     |
| MAX6316LUK____/V+T | -40°C to +125°C | 5 SOT23     |
| MAX6316MUK____-T   | -40°C to +125°C | 5 SOT23     |
| MAX6317HUK____-T   | -40°C to +125°C | 5 SOT23     |
| MAX6318HUK____-T   | -40°C to +125°C | 5 SOT23     |
| MAX6318MHUK____-T  | -40°C to +125°C | 5 SOT23     |

Devices are available in both leaded and lead(Pb)-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering. /V Denotes an automotive-qualified part.

Ordering Information continued at end of data sheet.

## Absolute Maximum Ratings

Voltage (with respect to GND)

$V_{CC}$ .....-0.3V to +6V

$\overline{\text{RESET}}$  (MAX6320/MAX6321/MAX6322 only)..... -0.3V to +6V

All Other Pins.....-0.3V to ( $V_{CC} + 0.3$ V)

Input/Output Current, All Pins .....20mA

Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )

SOT23 (derate 7.1mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ).....571mW

Operating Temperature Range.....-40 $^\circ\text{C}$  to +125 $^\circ\text{C}$

Junction Temperature .....+150 $^\circ\text{C}$

Storage Temperature Range.....-65 $^\circ\text{C}$  to +160 $^\circ\text{C}$

Lead Temperature (soldering, 10s) .....+300 $^\circ\text{C}$

Soldering Temperature (reflow)

Leaded Package .....+240 $^\circ\text{C}$

Lead-Free Package .....+260 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Electrical Characteristics

( $V_{CC} = 2.5\text{V}$  to  $5.5\text{V}$ ,  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_A = +25^\circ\text{C}$ .) (Note 1)

**Note 1:** Overtemperature limits are guaranteed by design, not production tested.

**Note 2:** A factory-trimmed voltage divider programs the nominal reset threshold ( $V_{TH}$ ). Factory-trimmed reset thresholds are available in 100mV increments from 2.5V to 5V (see Table 1 at end of data sheet).

**Note 3:** Guaranteed by design.

**Electrical Characteristics (continued)**(V<sub>CC</sub> = 2.5V to 5.5V, T<sub>A</sub> = -40°C to +125°C, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 1)

Reset is asserted when $V_{\text{CC}}$ drops below the Reset Threshold Voltage ( $V_{\text{RST}}$ ). Reset remains asserted until $V_{\text{CC}}$ rises above $V_{\text{RST}}$ and for the duration of the Reset Timeout Period ( $t_{\text{RP}}$ ) once $V_{\text{CC}}$ rises above $V_{\text{RST}}$ .          |

Figure 1. Functional Diagram

## Detailed Description

A microprocessor's ( $\mu$ P) reset input starts or restarts the  $\mu$ P in a known state. The reset output of the MAX6316–MAX6322  $\mu$ P supervisory circuits interfaces with the reset input of the  $\mu$ P, preventing code-execution errors during power-up, power-down, and brownout conditions (see the *Typical Operating Circuit*). The MAX6316/MAX6317/MAX6318/MAX6320/MAX6321 are also capable of asserting a reset should the  $\mu$ P become stuck in an infinite loop.

### Reset Output

The MAX6316L/MAX6318LH/MAX6319LH feature an active-low reset output, while the MAX6317H/MAX6318\_H/MAX6319\_H/MAX6321HP/MAX6322HP feature an active-high reset output.  $\overline{\text{RESET}}$  is guaranteed to be a logic low and RESET is guaranteed to be a logic high for  $V_{CC}$  down to 1V.

The MAX6316–MAX6322 assert reset when  $V_{CC}$  is below the reset threshold ( $V_{RST}$ ), when  $\overline{\text{MR}}$  is pulled low (MAX6316\_/MAX6317H/MAX6319\_H/MAX6320P/MAX6322HP only), or if the WDI pin is not serviced within

the watchdog timeout period ( $t_{WD}$ ). Reset remains asserted for the specified reset active timeout period ( $t_{RP}$ ) after  $V_{CC}$  rises above the reset threshold, after  $\overline{\text{MR}}$  transitions low to high, or after the watchdog timer asserts the reset (MAX6316\_/MAX6317H/MAX6318\_H/MAX6320P/MAX6321HP). After the reset active timeout period ( $t_{RP}$ ) expires, the reset output deasserts, and the watchdog timer restarts from zero (Figure 2).

Figure 2. Reset Timing Diagram

### Bidirectional $\overline{\text{RESET}}$ Output

The MAX6316M/MAX6318MH/MAX6319MH are designed to interface with  $\mu$ Ps that have bidirectional reset pins, such as the Motorola 68HC11. Like an open-drain output, these devices allow the  $\mu$ P or other devices to pull the bidirectional reset ( $\overline{\text{RESET}}$ ) low and assert a reset condition. However, unlike a standard open-drain output, it includes the commonly specified  $4.7\text{k}\Omega$  pullup resistor with a P-channel active pullup in parallel.

This configuration allows the MAX6316M/MAX6318MH/MAX6319MH to solve a problem associated with  $\mu$ Ps that have bidirectional reset pins in systems where several devices connect to  $\overline{\text{RESET}}$  (Figure 3). These  $\mu$ Ps can often determine if a reset was asserted by an external device (i.e., the supervisor IC) or by the  $\mu$ P itself (due to a watchdog fault, clock error, or other source), and then jump to a vector appropriate for the source of the reset. However, if the  $\mu$ P does assert reset, it does not retain the information, but must determine the cause after the reset has occurred.

The following procedure describes how this is done in the Motorola 68HC11. In all cases of reset, the  $\mu$ P pulls  $\overline{\text{RESET}}$  low for about four external-clock cycles. It then releases  $\overline{\text{RESET}}$ , waits for two external-clock cycles, then checks  $\overline{\text{RESET}}$ 's state. If  $\overline{\text{RESET}}$  is still low, the  $\mu$ P concludes that the source of the reset was external and, when  $\overline{\text{RESET}}$  eventually reaches the high state, it jumps to the normal reset vector. In this case, stored-state information is erased and processing begins from

scratch. If, on the other hand,  $\overline{\text{RESET}}$  is high after a delay of two external-clock cycles, the processor knows that it caused the reset itself and can jump to a different vector and use stored-state information to determine what caused the reset.

A problem occurs with faster  $\mu$ Ps; two external-clock cycles are only 500ns at 4MHz. When there are several devices on the reset line, and only a passive pullup resistor is used, the input capacitance and stray capacitance can prevent  $\overline{\text{RESET}}$  from reaching the logic high state ( $0.8 \times V_{CC}$ ) in the time allowed. If this happens, all resets will be interpreted as external. The  $\mu$ P output stage is guaranteed to sink 1.6mA, so the rise time can not be reduced considerably by decreasing the  $4.7\text{k}\Omega$  internal pullup resistance. See Bidirectional Pullup Characteristics in the *Typical Operating Characteristics*.

The MAX6316M/MAX6318MH/MAX6319MH overcome this problem with an active pullup FET in parallel with the  $4.7\text{k}\Omega$  resistor (Figures 4 and 5). The pullup transistor holds  $\overline{\text{RESET}}$  high until the  $\mu$ P reset I/O or the supervisory circuit itself forces the line low. Once  $\overline{\text{RESET}}$  goes below  $V_{PTH}$ , a comparator sets the transition edge flip-flop, indicating that the next transition for  $\overline{\text{RESET}}$  will be low to high. When  $\overline{\text{RESET}}$  is released, the  $4.7\text{k}\Omega$  resistor pulls  $\overline{\text{RESET}}$  up toward  $V_{CC}$ . Once  $\overline{\text{RESET}}$  rises above  $V_{PTH}$  but is below ( $0.85 \times V_{CC}$ ), the active P-channel pullup turns on. Once  $\overline{\text{RESET}}$  rises above ( $0.85 \times V_{CC}$ ) or the 2 $\mu$ s one-shot times out, the active pullup turns off. The parallel combination of the  $4.7\text{k}\Omega$  pullup and the

Figure 3. MAX6316M/MAX6318MH/MAX6319MH Supports Additional Devices on the Reset Bus

Figure 4. MAX6316/MAX6318MH/MAX6319MH Bidirectional Reset Output Functional Diagram

P-channel transistor on-resistance quickly charges stray capacitance on the reset line, allowing  $\overline{\text{RESET}}$  to transition from low to high within the required two electronic-clock cycles, even with several devices on the reset line. This process occurs regardless of whether the reset was caused by  $V_{CC}$  dipping below the reset threshold, the watchdog timing out,  $\overline{\text{MR}}$  being asserted, or the  $\mu$ P or other device asserting  $\overline{\text{RESET}}$ . The parts do not require an external pullup. To minimize supply current consumption, the internal  $4.7\text{k}\Omega$  pullup resistor disconnects from the supply whenever the MAX6316M/MAX6318MH/MAX6319MH assert reset.

### Open-Drain $\overline{\text{RESET}}$ Output

The MAX6320P/MAX6321HP/MAX6322HP have an active-low, open-drain reset output. This output structure will sink current when  $\overline{\text{RESET}}$  is asserted. Connect a pullup resistor from  $\overline{\text{RESET}}$  to any supply voltage up to 6V (Figure 6). Select a resistor value large enough to

Figure 5. Bidirectional  $\overline{\text{RESET}}$  Timing Diagram

Figure 6. MAX6320P/MAX6321HP/MAX6322HP Open-Drain  $\overline{\text{RESET}}$  Output Allows Use with Multiple Supplies

register a logic low (see *Electrical Characteristics*), and small enough to register a logic high while supplying all input current and leakage paths connected to the  $\overline{\text{RESET}}$  line. A  $10\text{k}\Omega$  pullup is sufficient in most applications.

### Manual-Reset Input

The MAX6316\_/MAX6317H/MAX6319\_H/MAX6320P/MAX6322HP feature a manual reset input. A logic low on  $\overline{\text{MR}}$  asserts a reset. After  $\overline{\text{MR}}$  transitions low to high, reset remains asserted for the duration of the reset timeout period ( $t_{RP}$ ). The  $\overline{\text{MR}}$  input is connected to  $V_{CC}$  through an internal  $52\text{k}\Omega$  pullup resistor and therefore can be left unconnected when not in use.  $\overline{\text{MR}}$  can be driven with TTL-logic levels in 5V systems, with CMOS-logic levels in 3V systems, or with open-drain or open-collector output devices. A normally-open momentary switch from  $\overline{\text{MR}}$  to ground can also be used; it requires no external debouncing circuitry.  $\overline{\text{MR}}$  is designed to reject fast, negative-going transients (typically 100ns pulses). A  $0.1\mu\text{F}$  capacitor from  $\overline{\text{MR}}$  to ground provides additional noise immunity.

The  $\overline{\text{MR}}$  input pin is equipped with internal ESD-protection circuitry that may become forward biased. Should  $\overline{\text{MR}}$  be driven by voltages higher than  $V_{CC}$ , excessive current would be drawn, which would damage the part. For example, assume that  $\overline{\text{MR}}$  is driven by a +5V supply other than  $V_{CC}$ . If  $V_{CC}$  drops lower than +4.7V,  $\overline{\text{MR}}$ 's absolute maximum rating is violated [ $-0.3\text{V}$  to  $(V_{CC} + 0.3\text{V})$ ], and undesirable current flows through the ESD structure from  $\overline{\text{MR}}$  to  $V_{CC}$ . To avoid this, use the same supply for  $\overline{\text{MR}}$  as the supply monitored by  $V_{CC}$ . This guarantees that the voltage at  $\overline{\text{MR}}$  will never exceed  $V_{CC}$ .

### Watchdog Input

The MAX6316\_/MAX6317H/MAX6318\_H/MAX6320P/MAX6321HP feature a watchdog circuit that monitors the  $\mu$ P's activity. If the  $\mu$ P does not toggle the watchdog input (WDI) within the watchdog timeout period ( $t_{WD}$ ), reset asserts. The internal watchdog timer is cleared by reset or by a transition at WDI (which can detect pulses as short as 50ns). The watchdog timer remains cleared while reset is asserted. Once reset is released, the timer begins counting again (Figure 7).

The WDI input is designed for a three-stated output device with a  $10\mu\text{A}$  maximum leakage current and the capability of driving a maximum capacitive load of  $200\text{pF}$ . The three-state device must be able to source and sink at least  $200\mu\text{A}$  when active. Disable the watchdog function by leaving WDI unconnected or by three-stating the driver connected to WDI. When the watchdog timer is left open circuited, the timer is cleared internally at intervals equal to 7/8 of the watchdog period.

Figure 7. Watchdog Timing Relationship

## Applications Information

### Watchdog Input Current

The WDI input is internally driven through a buffer and series resistor from the watchdog counter. For minimum watchdog input current (minimum overall power consumption), leave WDI low for the majority of the watchdog timeout period. When high, WDI can draw as much as 160 $\mu$ A. Pulsing WDI high at a low duty cycle will reduce the effect of the large input current. When WDI is left unconnected, the watchdog timer is serviced within the watchdog timeout period by a low-high-low pulse from the counter chain.

### Negative-Going VCC Transients

These supervisors are immune to short-duration, negative-going VCC transients (glitches), which usually do not require the entire system to shut down. Typically, 200ns large-amplitude pulses (from ground to VCC) on the supply will not cause a reset. Lower amplitude pulses result in greater immunity. Typically, a VCC transient that goes 100mV under the reset threshold and lasts less than 4 $\mu$ s will not trigger a reset. An optional 0.1 $\mu$ F bypass capacitor mounted close to VCC provides additional transient immunity.

### Ensuring Valid Reset Outputs Down to VCC = 0V

The MAX6316/\_MAX6317H/MAX6318\_H/MAX6319\_H/MAX6321HP/MAX6322HP are guaranteed to operate properly down to VCC = 1V. In applications that require valid reset levels down to VCC = 0V, a pulldown resistor to active-low outputs (push/pull and bidirectional only, Figure 8) and a pullup resistor to active-high outputs (push/pull only, Figure 9) will ensure that the reset line is valid while the reset output can no longer sink or

Figure 8. Ensuring  $\overline{\text{RESET}}$  Valid to VCC = 0V on Active-Low Push/Pull and Bidirectional OutputsFigure 9. Ensuring  $\text{RESET}$  Valid to VCC = 0V on Active-High Push/Pull Outputs

source current. This scheme does not work with the open-drain outputs of the MAX6320/MAX6321/MAX6322. The resistor value used is not critical, but it must be large enough not to load the reset output when VCC is above the reset threshold. For most applications, 100k $\Omega$  is adequate.

### Watchdog Software Considerations (MAX6316/MAX6317/MAX6318/MAX6320/MAX6321)

One way to help the watchdog timer monitor software execution more closely is to set and reset the watchdog input at different points in the program, rather than pulsing the watchdog input high-low-high or low-high-low. This technique avoids a stuck loop, in which the watchdog timer would continue to be reset inside the loop, keeping the watchdog from timing out.

Figure 10 shows an example of a flow diagram where the I/O driving the watchdog input is set high at the beginning of the program, set low at the end of every subroutine or loop, then set high again when the program returns to the beginning. If the program should hang in any subroutine, the problem would be quickly corrected, since the I/O is continually set low and the watchdog timer is allowed to time out, causing a reset or interrupt to be issued. As described in the *Watchdog Input Current* section, this scheme results in higher time average WDI current than does leaving WDI low for the majority of the timeout period and periodically pulsing it low-high-low.

| MAX6321HPUK____-T  | -40°C to +125°C | 5 SOT23     |
| MAX6322HPUK____-T  | -40°C to +125°C | 5 SOT23     |

Devices are available in both leaded and lead(Pb)-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering. /V Denotes an automotive-qualified part.

**Note:** These devices are available with factory-set  $V_{CC}$  reset thresholds from 2.5V to 5V, in 0.1V increments. Insert the desired nominal reset threshold (25 to 50, from Table 1) into the blanks following the letters UK. All devices offer factory-programmed reset timeout periods. Insert the letter corresponding to the desired reset timeout period (A, B, C, or D from Table 3) into the blank following the reset threshold suffix. Parts that offer a watchdog feature (see Selector Guide) are factory-trimmed to one of four watchdog timeout periods. Insert the letter corresponding to the desired watchdog timeout period (W, X, Y, or Z from Table 3) into the blank following the reset timeout suffix.

## Package Information

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a “+”, “#”, or “-” in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE TYPE | PACKAGE CODE | OUTLINE NO.             | LAND PATTERN NO.        |

| 0                  | 1/98             | Initial release.                                                                                                                                       | —                   |
| 1                  | 4/98             | Update to show MAX6319 as an existing part.                                                                                                            | 1, 2, 12            |
| 2                  | 7/98             | Update specifications, <i>Selector Guide</i> , and Table 2.                                                                                            | 1, 12, 14           |
| 3                  | 1/99             | Include extended temperature range in <i>EC</i> table globals, Table 1, <i>Ordering Information</i> .                                                  | 1, 2, 3, 12, 13, 14 |
| 4                  | 11/99            | Update available products and versions in Table 2 and <i>Ordering Information</i> .                                                                    | 1, 12, 14           |
| 5                  | 9/02             | Addition of $\overline{\text{RESET}}$ rise time specification to <i>Electrical Characteristics</i> table.                                              | 1, 2                |
| 6                  | 12/05            | Add lead-free option to <i>Ordering Information</i> .                                                                                                  | 1, 13, 14           |
| 7                  | 11/07            | Add automotive temperature to <i>Ordering Information</i> , <i>Electrical Characteristics</i> table, Table 1, and updated <i>Package Information</i> . | 1, 2, 3, 12, 13, 14 |
| 8                  | 8/09             | Updated <i>Ordering Information</i> .                                                                                                                  | 13                  |
| 9                  | 6/10             | Added automotive part and soldering temperatures.                                                                                                      | 2, 13               |
| 10                 | 10/11            | Added automotive-qualified part ordering option for MAX6316 family                                                                                     | 1                   |
| 11                 | 2/13             | Changed <i>N</i> -T suffix to <i>N</i> +T in <i>Ordering Information</i>                                                                               | 1                   |
| 12                 | 4/15             | Updated the <i>General Description</i> and <i>Benefits and Features</i> sections                                                                       | 1                   |

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at [www.maximintegrated.com](http://www.maximintegrated.com).

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the *Electrical Characteristics* table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.
