Maximum base plate temperature of the resistor must be monitored and kept within specified limits to establish the power rating. Best technique is to attach a thermocouple to the side of the base plate of the resistor. Temperature of plastic housing or heat sink cannot be used to establish rating of the resistor.

Ohmite's TAP800 Series dissipates 800 watts of power when used with a liquid or air cooled heat sink system. The TAP800 rounds out 600 watt (TAP600) and 1000 watt (TAP1000) product offerings. Applications include variable speed drives, power supplies, robotics, motor control, control devices, and other power designs.

- Electric support is high alumina content ceramic metallized on the bottom for ideal heat transfer and optimum discharge.
- Encapsulated with a special resin filled epoxy casing with a large creepage distance to mass, large air distance between terminals, and a high insulation resistance (CTI 600).
- Resistive element is specially designed for low inductance and capacitance. The element provides stable performance in addition to high wattage and pulse loading capability.
- Contacts allow for easy load connection with M5 screws (not included) available with M4 as special request.
- Materials meet the requirements of UL94-V0
- High current version available: 0.1 to 0.25 ohms; 10% tol.

bottom case temp. This value is only valid by using a thermal conduction to the heatsink $R_{th-cs} < 0.025^{\circ}\text{K/W}$. This value can be reached by using thermal transfer compound with a heat conductivity of 1W/mK . The flatness of the cooling plate must be better than 0.05mm overall. The roughness of the surface should not exceed $6.4\mu\text{m}$.
