

ADC1113S125

Single 11-bit ADC; serial JESD204A interface

Rev. 02 — 2 July 2012

Product data sheet

1. General description

The ADC1113S125 is a single channel 11-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power at a sample rate of 125 Msps. Pipelined architecture and output error correction ensure the ADC1113S125 is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a 3 V source for analog and a 1.8 V source for the output driver, it outputs data in serial mode via a single differential lane, which complies with the JESD204A standard. The integration of Serial Peripheral Interface (SPI) allows the user to easily configure the ADCs and the serial output modes. The device also includes a programmable full-scale SPI to allow a flexible input voltage range from 1 V (p-p) to 2 V (p-p).

Excellent dynamic performance is maintained from the baseband to input frequencies of 170 MHz or more, making the ADC1113S125 ideal for use in communications, imaging, and medical applications.

2. Features and benefits

- SNR, 66.2 dBFS; SFDR, 87 dBc
- Sample rate: 125 Msps
- Single channel, 11-bit pipelined ADC core
- 3 V, 1.8 V power supplies
- Flexible input voltage range: 1 V (p-p) to 2 V (p-p)
- Serial output
- Compliant with JESD204A serial transmission standard
- Pin compatible with ADC1613S series, ADC1413S series, and ADC1213S series
- Input bandwidth, 600 MHz
- Power dissipation, 550 mW at 80 Msps
- SPI register programming
- Duty cycle stabilizer
- High Intermediate Frequency (IF) capability
- Offset binary, two's complement, gray code
- Power-down mode and Sleep mode
- HVQFN32 package

3. Applications

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems

11. Application information

11.1 Analog inputs

11.1.1 Input stage description

The analog input of the ADC1113S supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ($V_{I(cm)}$) on pins INP and INM set to $0.5V_{DDA}$.

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see Section 11.2 and Table 21).

Figure 6 shows the equivalent circuit of the sample-and-hold input stage, including ElectroStatic Discharge (ESD) protection and circuit and package parasitics.

Fig 6. Input sampling circuit

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

11.1.2 Anti-kickback circuitry

Anti-kickback circuitry (RC filter in Figure 7) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 9. RC-coupling versus input frequency, typical values

Input frequency (MHz)	Resistance (Ω)	Capacitance (pF)
3	25	12
70	12	8
170	12	8

11.1.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in Figure 8 would be suitable for a baseband application.

The configuration shown in Figure 9 is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

11.2 System reference and power management

11.2.1 Internal/external reference

The ADC1113S has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (see Figure 11 to Figure 14), in 1 dB steps between 0 dB and -6 dB, via SPI control bits INTREF[2:0] (when bit INTREF_EN = logic 1; see Table 21). The equivalent reference circuit is shown in Figure 10. An external reference is also possible by providing a voltage on pin VREF as described in Figure 14.

Fig 10. Reference equivalent schematic

If bit INTREF_EN is set to logic 0, the reference voltage is determined either internally or externally as detailed in Table 10.

Table 10. Reference modes

Mode	SPI bit, "Internal reference"	SENSE pin	VREF pin	Full-scale (V (p-p))
Internal (Figure 11)	0	GND	330 pF capacitor to GND	2
Internal (Figure 12)	0	VREF pin = SENSE pin and 330 pF capacitor to GND		1
Internal, SPI mode (Figure 12)	1	VREF pin = SENSE pin and 330 pF capacitor to GND		1 to 2
External (Figure 14)	0	V _{DDA}	external voltage from 0.5 V to 1 V	1 to 2

Figure 11 to Figure 14 illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

Fig 13. Internal reference via SPI, 1 V (p-p) to 2 V (p-p) full-scale

Fig 14. External reference, 1 V (p-p) to 2 V (p-p) full-scale

11.2.2 Programmable full-scale

The full-scale is programmable between 1 V (p-p) to 2 V (p-p) (see Table 11).

Table 11. Reference SPI gain control

INTREF[2:0]	Level (dB)	Full-scale (V (p-p))
000	0	2
001	−1	1.78
010	−2	1.59
011	−3	1.42
100	−4	1.26
101	−5	1.12
110	−6	1
111	not used	x

11.2.3 Common-mode output voltage ($V_{O(cm)}$)

An 0.1 μ F filter capacitor should be connected between pin VCM and ground to ensure a low-noise common-mode output voltage. When AC-coupled, this pin can be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

11.2.4 Biasing

The common-mode input voltage ($V_{I(cm)}$) on pins INP and INM should be set externally to $0.5V_{DDA}$ for optimal performance and should always be between 0.9 V and 2 V.

11.3 Clock input

11.3.1 Drive modes

The ADC1113S125 can be driven differentially (LVPECL). It can also be driven by a single-ended LVCMOS signal connected to pin CLKP (CLKM should be connected to ground via a capacitor).

11.3.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in Figure 18. The common-mode voltage of the differential input stage is set via internal 5 k Ω resistors.

Single-ended or differential clock inputs can be selected via the SPI (see Table 20). If single-ended is selected, the input pin (CLKM or CLKP) is selected via control bit SE_SEL.

If single-ended is implemented without setting bit SE_SEL accordingly, the unused pin should be connected to ground via a capacitor.

11.3.3 Duty cycle stabilizer

The duty cycle stabilizer can improve the overall performance of the ADC by compensating the input clock signal duty cycle. When the duty cycle stabilizer is active (bit DCS_EN = logic 1; see Table 20), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

Table 12. Duty cycle stabilizer

Bit DCS_EN	Description
0	duty cycle stabilizer disable
1	duty cycle stabilizer enable

11.3.4 Clock input divider

The ADC1113S contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV2_SEL = logic 1; see Table 20). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

11.4 Digital outputs

11.4.1 Serial output equivalent circuit

The JESD204A standard specifies that if the receiver and the transmitter are DC-coupled, both must be fed from the same supply.

Fig 19. CML output connection to the receiver (DC-coupled)

The output should be terminated when 100 Ω (typical) is reached at the receiver side.

11.5 JESD204A serializer

For more information about the JESD204A standard refer to the JEDEC web site.

11.5.1 Digital JESD204A formatter

The block placed after the ADC core is used to implement all functions of the JESD204A standard. This ensures signal integrity and guarantees the clock and the data recovery at the receiver side.

The block is highly parameterized and can be configured in various ways depending on the sampling frequency and the number of lanes used.

Fig 22. Detailed view of the JESD204A serializer with debug functionality

11.5.2 ADC core output codes versus input voltage

11.6 Serial Peripheral Interface (SPI)

11.6.1 Register description

The ADC1113S serial interface is a synchronous serial communications port allowing for easy interfacing with many industry microprocessors. It provides access to the registers that control the operation of the chip in both read and write modes.

This interface is configured as a 3-wire type (SDIO as bidirectional pin).

Pin SCLK acts as the serial clock and pin $\overline{\text{CS}}$ acts as the serial chip select.

Each read/write operation is sequenced by the $\overline{\text{CS}}$ signal and enabled by a LOW level to drive the chip with N bytes, depending on the content of the instruction byte (see Table 14).

Table 14. SPI instruction bytes

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
Description	R/W ^[1]	W1	W0	A12	A11	A10	A9	A8
	A7	A6	A5	A4	A3	A2	A1	A0

[1] R/W indicates whether a read (logic 1) or write (logic 0) transfer occurs after the instruction byte.

Table 15. Read or Write mode access description

R/W ^[1]	Description
0	Write mode operation
1	Read mode operation

[1] Bits W1 and W0 indicate the number of bytes transferred.

Table 16. Number of bytes to be transferred

W1	W0	Number of bytes transferred
0	0	1 byte
0	1	2 bytes
1	0	3 bytes
1	1	4 or more bytes

Bits A12 to A0 indicate the address of the register being accessed. In the case of a multiple byte transfer, this address is the first register to be accessed. An address counter is incremented to access subsequent addresses.

The steps involved in a data transfer are as follows:

1. The falling edge on pin $\overline{\text{CS}}$ in combination with a rising edge on pin SCLK determine the start of communications.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data which can vary in length but is always a multiple of 8 bits. The Most Significant Bit (MSB) is always sent first (for instruction and data bytes)
4. A rising edge on pin $\overline{\text{CS}}$ indicates the end of data transmission.

Table 18. Register SPI control (address 0003h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	-	-	111111	not used
1	ENABLE	R/W		ADC SPI control enable:
			0	ADC does not get the next SPI command
			1	ADC gets the next SPI command
0	-	-	1	not used

Table 19. Register Reset and Power-down mode (address 0005h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7	SW_RST	R/W		reset digital part:
			0	no reset
			1	performs a reset of the digital part
6 to 2	-	-	00000	not used
1 to 0	PD[1:0]	R/W		Power-down mode:
			00	normal (power-up)
			01	full power-down
			10	sleep

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7	-	-	0	not used
6	CS[0]	R/W	1	defines the number of control bits per sample, minus 1
5 to 4	-	-	00	not used
3 to 0	N[3:0]	R/W	0001	defines the converter resolution

Table 40. Cfg_8_Np (address 0827h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 5	-	-	000	not used
4 to 0	NP[4:0]	R/W	01111	defines the total number of bits per sample, minus 1

Table 41. Cfg_9_S (address 0828h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 1	-	-	0000000	not used
0	S	R/W	0	defines number of samples per converter per frame cycle

Table 42. Cfg_10_HD_CF (address 0829h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7	HD	R/W	*	defines high density format
6 to 2	-	-	00000	not used
1 to 0	CF[1:0]	R/W	00	defines number of control words per frame clock cycle per link.

Table 43. Cfg_02_2_LID (address 082Dh)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 5	-	-	000	not used
4 to 0	LID[4:0]	R/W	11100	defines lane identification number

Table 44. Cfg02_13_FCHK (address 084Dh)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	FCHK[7:0]	R	*****	defines the checksum value for lane checksum corresponds to the sum of all the link configuration parameters module 256 (as defined in JEDEC Standard No.204A)

Table 45. Lane_0_Ctrl (address 0871h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7	-	-	0	not used
6	SCR_IN_MODE	R/W	0 (reset)	defines the input type for scrambler and 8-bit/10-bit units (normal mode) = input of the scrambler and 8-bit/10-bit units is the output of the frame assembly unit.
			1	input of the scrambler and 8-bit/10-bit units is the PRBS generator (PRBS type is defined with "PRBS_TYPE[1:0]" (Ser_PRBS_Ctrl register)
5 to 4	LANE_MODE[1:0]	R/W		defines output type of lane output unit:
			00 (reset)	normal mode: lane output is the 8-bit/10-bit output unit
			01	constant mode: lane output is set to a constant (0 × 0)
			10	toggle mode: lane output is toggling between 0 × 0 and 0 × 1
			11	PRBS mode: lane output is the PRBS generator (PRBS type is defined with "PRBS_TYPE[1:0]" (Ser_PRBS_Ctrl register)
3	-	-	0	not used

Table 45. Lane_0_Ctrl (address 0871h) ...continued

Default values are highlighted.

Bit	Symbol	Access	Value	Description
2	LANE_POL	R/W		defines lane polarity:
			0	lane polarity is normal
			1	lane polarity is inverted
1	RESERVED	R/W	0	reserved
0	LANE_PD	R/W		lane power-down control:
			0	lane is operational
			1	lane is in Power-down mode

Table 46. ADC_0_Ctrl (address 0891h)

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 6	-	-	00	not used
5 to 4	ADC_MODE[1:0]	R/W		defines input type of JESD204A unit
			00 (reset)	ADC output is connected to the JESD204A input
			01	not used
			10	JESD204A input is fed with a dummy constant, set to: OTR = 0 and ADC[13:0] = "10011011101010"
			11	JESD204A is fed with a PRBS generator (PRBS type is defined with "PRBS_TYPE[1:0]" (Ser_PRBS_Ctrl register)
3 to 1	-	-	000	not used
0	ADC_PD	R/W		ADC power-down control:
			0	ADC is operational
			1	ADC is in Power-down mode
