Data Sheet

FEATURES:

- **Organized as 32K x8 / 64K x8 / 128K x8 / 256K x8**
- **4.5-5.5V Read Operation**
- **Superior Reliability**
 - Endurance: At least 1000 Cycles
 - Greater than 100 years Data Retention
- **Low Power Consumption**
 - Active Current: 20 mA (typical)
 - Standby Current: 10 μ A (typical)
- **Fast Read Access Time**
 - 70 ns
 - 90 ns
- **Fast Byte-Program Operation**
 - Byte-Program Time: 20 μ s (typical)
 - Chip Program Time:
 - 0.7 seconds (typical) for SST27SF256
 - 1.4 seconds (typical) for SST27SF512
 - 2.8 seconds (typical) for SST27SF010
 - 5.6 seconds (typical) for SST27SF020
- **Electrical Erase Using Programmer**
 - Does not require UV source
 - Chip-Erase Time: 100 ms (typical)
- **TTL I/O Compatibility**
- **JEDEC Standard Byte-wide EPROM Pinouts**
- **Packages Available**
 - 32-lead PLCC
 - 32-lead TSOP (8mm x 14mm)
 - 28-pin PDIP for SST27SF256/512
 - 32-pin PDIP for SST27SF010/020

PRODUCT DESCRIPTION

The SST27SF256/512/010/020 are a 32K x8 / 64K x8 / 128K x8 / 256K x8 CMOS, Many-Time Programmable (MTP) low cost flash, manufactured with SST's proprietary, high performance SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. These MTP devices can be electrically erased and programmed at least 1000 times using an external programmer with a 12 volt power supply. They have to be erased prior to programming. These devices conform to JEDEC standard pinouts for byte-wide memories.

Featuring high performance Byte-Program, the SST27SF256/512/010/020 provide a Byte-Program time of 20 μ s. Designed, manufactured, and tested for a wide spectrum of applications, these devices are offered with an endurance of at least 1000 cycles. Data retention is rated at greater than 100 years.

The SST27SF256/512/010/020 are suited for applications that require infrequent writes and low power nonvolatile storage. These devices will improve flexibility, efficiency, and performance while matching the low cost in nonvolatile applications that currently use UV-EPROMs, OTPs, and mask ROMs.

To meet surface mount and conventional through hole requirements, the SST27SF256/512 are offered in 32-lead PLCC, 32-lead TSOP, and 28-pin PDIP packages. The SST27SF010/020 are offered in 32-pin PDIP, 32-lead PLCC, and 32-lead TSOP packages. See Figures 1, 2, and 3 for pin assignments.

Device Operation

The SST27SF256/512/010/020 are a low cost flash solution that can be used to replace existing UV-EPROM, OTP, and mask ROM sockets. These devices are functionally (read and program) and pin compatible with industry standard EPROM products. In addition to EPROM functionality, these devices also support electrical Erase operation via an external programmer. They do not require a UV source to erase, and therefore the packages do not have a window.

Read

The Read operation of the SST27SF256/512/010/020 is controlled by CE# and OE#. Both CE# and OE# have to be low for the system to obtain data from the outputs. Once the address is stable, the address access time is equal to the delay from CE# to output (T_{CE}). Data is available at the output after a delay of T_{OE} from the falling edge of OE#, assuming that CE# pin has been low and the addresses have been stable for at least $T_{CE}-T_{OE}$. When the CE# pin is high, the chip is deselected and a typical standby current of 10 μ A is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high.

256 Kbit / 512 Kbit / 1 Mbit / 2 Mbit Many-Time Programmable Flash SST27SF256 / SST27SF512 / SST27SF010 / SST27SF020

Data Sheet

Byte-Program Operation

The SST27SF256/512/010/020 are programmed by using an external programmer. The programming mode for SST27SF256/010/020 is activated by asserting 11.4-12.6V on V_{PP} pin, $V_{DD} = 4.5-5.5V$, V_{IL} on CE# pin, and V_{IH} on OE# pin. The programming mode for SST27SF512 is activated by asserting 11.4-12.6V on OE#/V_{PP} pin, $V_{DD} = 4.5-5.5V$, and V_{IL} on CE# pin. These devices are programmed byte-by-byte with the desired data at the desired address using a single pulse (CE# pin low for SST27SF256/512 and PGM# pin low for SST27SF010/020) of 20 μs . Using the MTP programming algorithm, the Byte-Programming process continues byte-by-byte until the entire chip has been programmed.

Chip-Erase Operation

The only way to change a data from a "0" to "1" is by electrical erase that changes every bit in the device to "1". Unlike traditional EPROMs, which use UV light to do the Chip-Erase, the SST27SF256/512/010/020 uses an electrical Chip-Erase operation. This saves a significant amount of time (about 30 minutes for each Erase operation). The entire chip can be erased in a single pulse of 100 ms (CE# pin low for SST27SF256/512 and PGM# pin for SST27SF010/020). In order to activate the Erase mode for SST27SF256/010/020, the 11.4-12.6V is applied to V_{PP} and A₉ pins, $V_{DD} = 4.5-5.5V$, V_{IL} on CE# pin, and V_{IH} on OE# pin. In order to activate Erase mode for SST27SF512, the 11.4-12.6V is applied to OE#/V_{PP} and A₉ pins, $V_{DD} = 4.5-5.5V$, and V_{IL} on CE# pin. All other address and data

pins are "don't care". The falling edge of CE# (PGM# for SST27SF010/020) will start the Chip-Erase operation. Once the chip has been erased, all bytes must be verified for FFH. Refer to Figures 13, 14, and 15 for the flowcharts.

Product Identification Mode

The Product Identification mode identifies the devices as the SST27SF256, SST27SF512, SST27SF010 and SST27SF020 and manufacturer as SST. This mode may be accessed by the hardware method. To activate this mode for SST27SF256/010/020, the programming equipment must force V_H (11.4-12.6V) on address A₉ with V_{PP} pin at V_{DD} (4.5-5.5V) or V_{SS} . To activate this mode for SST27SF512, the programming equipment must force V_H (11.4-12.6V) on address A₉ with OE#/V_{PP} pin at V_{IL} . Two identifier bytes may then be sequenced from the device outputs by toggling address line A₀. For details, see Tables 3, 4, and 5 for hardware operation.

TABLE 16: PROGRAM/ERASE CYCLE TIMING PARAMETERS FOR SST27SF010/020

Symbol	Parameter	Min	Max	Units
T _{CES}	CE# Setup Time	1		μs
T _{CEH}	CE# Hold Time	1		μs
T _{AS}	Address Setup Time	1		μs
T _{AH}	Address Hold Time	1		μs
T _{PRT}	V _{PP} Pulse Rise Time	50		ns
T _{VPS}	V _{PP} Setup Time	1		μs
T _{VPH}	V _{PP} Hold Time	1		μs
T _{PW}	PGM# Program Pulse Width	20	30	μs
T _{EW}	PGM# Erase Pulse Width	100	500	ms
T _{DS}	Data Setup Time	1		μs
T _{DH}	Data Hold Time	1		μs
T _{VR}	A ₉ Recovery Time for Erase	1		μs
T _{ART}	A ₉ Rise Time to 12V during Erase	50		ns
T _{A9S}	A ₉ Setup Time during Erase	1		μs
T _{A9H}	A ₉ Hold Time during Erase	1		μs

T16.0 502

The diagram illustrates the timing relationships for a memory device. The signals shown are ADDRESS, CE# (Chip Enable), OE# (Output Enable), and DQ7-0 (Data Bus). The data bus is shown in a HIGH-Z state when not active and as DATA VALID when active. Key timing parameters are indicated by arrows and labels: T_{RC} (Row to Column delay), T_{AA} (Access to Array delay), T_{CE} (Chip Enable delay), T_{OE} (Output Enable delay), T_{OH} (Output Hold delay), T_{OHZ} (Output to High-Z delay), T_{CHZ} (Column to High-Z delay), T_{OLZ} (Output to Low-Z delay), and T_{CLZ} (Column to Low-Z delay).

The diagram illustrates the timing relationships for the 502 ILL F04a device. It includes the following signals and parameters:

- ADDRESS (EXCEPT A₉)**: Address bus signal.
- CE#**: Chip Enable signal.
- OE#**: Output Enable signal.
- V_{IH}**: Input high voltage level.
- DQ7-0**: Data bus signal.
- V_{PPH}**: Pull-up voltage level.
- V_{DD}**: Supply voltage level.
- V_{PP}**: Pull-up voltage level.
- V_{SS}**: Ground voltage level.
- A₉**: Address bus signal (bit 9).
- V_{IH}**: Input high voltage level.
- V_{IL}**: Input low voltage level.

Key timing parameters shown in the diagram include:

- T_{EW}**: Enable pulse width.
- T_{VPS}**: Pull-up time constant.
- T_{PRT}**: Pull-up time constant.
- T_{A9S}**: Address setup time.
- T_{TART}**: Address transition time.
- T_{VPH}**: Pull-up time constant.
- T_{VR}**: Pull-up time constant.
- T_{A9H}**: Address hold time.

Data Sheet

AC test inputs are driven at V_{IHT} (2.4 V) for a logic "1" and V_{ILT} (0.4 V) for a logic "0". Measurement reference points for inputs and outputs are V_{HT} (2.0 V) and V_{LT} (0.8 V). Input rise and fall times (10% $\leftrightarrow$ 90%) are <10 ns.

Note: V_{HT} - V_{HIGH} Test
 V_{LT} - V_{LOW} Test
 V_{IHT} - V_{INPUT} HIGH Test
 V_{ILT} - V_{INPUT} LOW Test

- Note:
1. Complies with JEDEC publication 95 MO-142 BA dimensions, although some dimensions may be more stringent.
 2. All linear dimensions are in millimeters (max/min).
 3. Coplanarity: 0.1 mm
 4. Maximum allowable mold flash is 0.15 mm at the package ends, and 0.25 mm between leads.
