3.2 Single event effect RBSOA

This products is extremely resistant to heavy ion environment for single event effect (as per MIL-STD-750E, method 1080, bias circuit of [Figure 2](#)).

SEB and SEGR tests are performed with a fluence of $3\text{e}+5$ ions/cm² with the following acceptance criteria:

- SEB test:
drain voltage checked, trigger level is set to $V_{DS} = -5$ V. Stop condition: as soon as a SEB occurs or if the fluence reaches $3\text{e}+5$ ions/cm².
- SEGR test:
the gate current is monitored every 200 ms. A gate stress is performed before and after irradiation. Stop condition: as soon as the gate current reaches 100 nA (during irradiation or during PIGS test) or if the fluence reaches $3\text{e}+5$ ions/cm².
